Crypto-Box Software Security, Marx Matrix Dongle, Dongle Emulator, Marx Dongle. .Q: Link a table in external text file in PowerQuery I have an external text file generated by PowerShell (or another way): File File Name ComputerName ComputerName1 WorkstationName WorkstationName1 DisplayName DisplayName1 UserName UserName1 I would like to add it to the table that PowerQuery currently create when I select this file. A: The file doesn't need to be an external file since it is a column in the file, just click "add columns" and then "from other sources". If you haven't already done this, be sure to add a column of type "Text" and name it as "File" and then double click "Text.GetContent". [edit] In my original reply, I didn't give a good explanation for the second part of your question. I've removed the incorrect line and am leaving the original answer to allow new users to see what my answer was. You can tell the text is coming from an external file

when it will NOT contain line breaks. In my experience, if you open it in Notepad++ and copy/paste it into PowerQuery, you will get errors since it is a text file and not a CSV or TSV file. However, you can Import the text as a column via the GUI or using the command line with the CII format (such as "*.txt" or "*.csv") as the input file. I don't recall if the "WorkstationName" or "DisplayName" come in each line as I find it easier to just Import the full text file line by line. If you get errors with an external file, I'd first check to see if the error is "Cannot import all strings in file XYZ.txt" or similar. John Kerry on Iran: 'I'm tired' Secretary of State John Kerry continues to insist on not bombing Iran, but has said he is "tired" of the nuclear issue. In an interview f678ea9f9e
